

# README

To get started, download the entire zip folders contents to your computer. Locate the folder in terminal.

## Running the server

First get your IP address: \* For WSL users, use the command *hostname -I* \*  
For MAC users, use the command *curl ifconfig.me*

Run the server as you would run any python file on your terminal, and add your IP address to the end of it. In WSL it will look like

```
python3 server.py 127.0.0.1
```

The server will run, nothing will appear until users connect.

to quit the application type “quit chat” in all lower case

## Running the client

On any computer (multiple computers can connect to the same server), as long as the entire folder is downloaded, run the following command.

```
python3 client.py (servers IP)
```

#In our example this will look like

```
python3 client.py 127.0.0.1
```

It will prompt you to enter a username. Once you do, you can begin chatting to everyone connected!

If you want to quit the application, type “quit” in all lowercase.
